PREAZISTENT PROTEINS AGAINST AGGREGATION AND MEDITATE THE POLDING OF UNGLISTENT PROTEINS AGAINST AGGREGATION AND MEDITATE THE POLDING OF UNGLISTENT PRANSLATED POLYPEPTIDES IN THE CYTOSOL AS WELL AS WITHIN ORGANELLES. THE HSP70S IN MITOCHONDRIA AND THE ENDOPLASMIC RETICULUM PLAR AN ADDITIONAL ROLE BY PROVIDING A DRIVING FORCE FOR PROTEIN TRANSLACION. HEY ARE INOLIVED IN SIGNAL TRANSDUCTION PATHWAYS IN COOPERATION WITH HSP90. THEY PARTICIPATE IN ALL THESE CONFORMATIONS OF OTHER PROTEINS. THEY BIND EXTENDED PEPTIDE SEGMENTS WITH A NET HYDROHOBIC CHARACTER EXPOSED BY POLYPEPTIDES CONFORMATIONS OF OTHER PROTEINS. THEY BIND EXTENDED PEPTIDE SEGMENTS WITH A NET HYDROHOBIC CHARACTER EXPOSED BY POLYPEPTIDES CONFORMATIONS OF DAMAGE.

STRESS-INDUCED DAMAGE.

-1-INDUCTION: BY HEAT SHOCK.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This SWISS-PROT entry is copyright. Structure of a new crystal form of human hsp70 Arpase domain.";
Acta Crystallogr. D 55:1105-1107(1999).
-! FUNCTION: IN COOPERATION WITH OTHER CHAPERONES, HSP70S STABILIZE
PREEXISTENT PROTEINS AGAINST AGGREGATION AND MEDIATE THE FOLDING
OF NEWLY TRANSLATED POLYEPPTIDES IN THE CYTOSOL AS WELL AS WITHIN
ORGANELLES. THE HSP70S IN MITOCHONDRIA AND THE ENDOPLASMIC
RETICULUM PLAY AN ADDITIONAL ROLE BY PROVIDING A DINJUNG FORE FOR
PROTEIN TRANSLOCATION. THEY ARE INVOLVED IN SIGNAL TRANSDUCTION
PATHWAYS IN COOPERATION WITH HSP90. THEY PARTICIPATE IN ALL THESE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Rowen L., Qin S., Madan A., Dickhoff R., Dors M., Madan A., Hicks P., Loretz C., Ratcliffe A., Abbasi N., Shaffer T., Hood L.; Sequence of the human major histocompatibility complex class III

PREEXISTENT PROTEINS AGAINST AGGREGATION AND MEDIATE THE FOLDING
OF NEWLY TRANSLATED POLYPEPTIDES IN THE CYTOSOL AS WELL AS WITHIN
ORGANELLES. THESE CHAPERONES PARTICIPATE IN ALL THESE PROCESSES
THROUGH THEIR ABILITY TO RECCONIZE NONNATIVE CONFORMATIONS OF
OTHER PROTEINS: THEY BIND EXTENDED PEPTIDE SEGMENTS WITH A NET
HYDOPHOBIC CHARACTER EXPOSED BY POLYPEPTIDES DURING TRANSLATION
AND MEMBRANE TRANSLOCATION, OR FOLLOWING STRESS-INDUCED DAMAGE.
-: SIMILARITY: BELONGS TO THE HEAT SHOCK PROTEIN 70 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

-I- FUNCTION: IN COOPERATION WITH OTHER CHAPERONES, HSP70S STABILIZE PREXISTENT PROTEINS AGAINST AGGREGATION AND MEDIATE THE FOLDING OF NEWLY TRANSLATED POLYPEPTIDES IN THE CYTOSOL AS WELL AS WITHIN ORGANELLES. THESE CHAPERONES PARTICIPATE IN ALL THESE PROCESSES THROUGH THEIR ABILITY TO RECOGNIZE NONNATURE CONFORMATIONS OF OTHER PROTEINS. THEY BIND EXTENDED PEPTIDES SEGMENTS WITH A NET HYDROPHOBIC CHARACTER REVOSED BY POLLYPEPTIDES DURING TRANSLATION AND MEMBRANE TRANSLOCATION, OR FOLLOWING STRESS-INDUCED DAMAGE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Rattus norvegicus (Rat).

Submitted (SEP-1994) to the SWISS-PROT data bank.
-!- FUNCTION: SSA1 MAY PLAY A ROLE IN THE TRANSPORT OF POLYPEPTIDES BOTH ACROSS THE MITOCHONDRIAL MEMBRANES AND INTO THE ENDOPLASMATIC RETICULUM. A FUNCTIONAL DIFFERENCE BETWEEN YEAST SSA1 AND SSA2 PROTEINS IS EXPECTED. SSA1 CAN PARTICIPATE IN THE ATP-DEPENDENT DISASSEMBLY OF CLATHRIN-COATED VESICLES.
-!- SUBCELLULAR LOCATION: CYTOPLASMIC.
                                                                                                                                                                                                                                                                                                              Garrels J.I., Futcher B., Kobayashi R., Latter G.I., Schwender B., Volpe T., Warner J.R., McLaughlin C.S.; Protein identifications for a Saccharomyces cerevisiae protein darabase ".

THE HSP70S IN MITOCHONDRIA AND THE ENDOPLASMIC RETICULUM PLAY AN ADDITIONAL ROLE BY PROVIDING A DRIVING FORCE FOR PROTEIN TRANSLOCATION. THEY ARE INVOLVED IN SIGNAL TRANSDUCTION PATHWAYS IN COOPERATION WITH HSP90. THEY PARTICIPATE IN ALL THESE PROCESSES THROUGH THEIR ABILITY TO RECOGNIZE NONNATIVE CONFORMATIONS OF OTHER PROTEINS. THEY BIND EXTENDED PREPTIDE SEGMENTS WITH A NET HYDROPHOBIC CHARACTER EXPOSED BY POLYPEPTIDES DURING TRANSLATION, OR FOLLOWING

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 14,

Chem. 268:23267-23274(1993).

FUNCTION: AFFECTS ACTIN POLYMERIZATION THROUGH INTERACTION WITH THE ACTIN-IBINDING PROTEIN CAP32/34. ACTS AS A CHAPERONE BY STIMULATING THE REFOLDING OF DENATURATED CAP32 AND CAP34.

SUBCELLULAR LOCATION: CYTOPLASMIC. FOUND IN F-ACTIN-RICH REGIONS OF THE CELL CORTEX AND CELL PROTRUSIONS.

DEVELOPMENTAL STAGE: HEAT SHOCK COGNATE PROTEINS ARE EXPRESSED CONSTITUTIVELY DURING NORMAL DEVELOPMENT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      SIMILARITY: BELONGS TO THE HEAT SHOCK PROTEIN 70 FAMILY.

Genet. 25:196-196(1994).

PREEXISTENT PROTEINS AGAINST AGGREGATION AND MEDIATE THE FOLDING OF NEWLY TRANSLATED POLYPEPTIDES IN THE CYTOSOL AS WELL AS WITHIN ORGANELLES. THE HSP70S IN MITOCHONDRIA AND THE ENDOPLASMIC RETICULUM PLAY AN ADDITIONAL ROLE BY PROVIDING A DRIVING FORCE FOR PROTEIN TRANSLOCATION. THEY ARE INVOLVED IN SIGNAL TRANSDUCTION PATHWAYS IN COOPERATION WITH HSP90. THEY PARTICIPATE IN ALL THESE PROCESSES THROUGH THEIR ABILITY TO RECOGNIZE NONNATIVE COMFORMATIONS OF OTHER PROTEINS. THEY BIND EXTENDED PEPTIDES SEGMENTS WITH A NET HYDROPHOBIC CHARACTER EXPOSED BY POLYPEPTIDES DURING TRANSLATION AND MEMBRANE TRANSLOCATION, OR FOLLOWING STRESS-INDUCED DAMAGE.

FINANCISCON TRANSLATED POLYPERTIDES IN THE CYTOSOL AS WELL AS WITHIN ORGANIZATED POLYPERTIDES IN THE CYTOSOL AS WELL AS WITHIN ORGANIZATED. FOLYPERTIDES IN THE CYTOSOL AS WELL AS WITHIN ORGANIZATES. THESE CHAPERONES PARTICIPATE IN ALL THESE PROCESSES THROUGH THEIR ABILITY TO RECOGNIZE NONNATIVE CONFORMATIONS OF OTHER PROTEINS. THEY BIND EXTENDED PROTIDE SEGMENTS WITH A NET HYDROPHOBIC CHARACTER EXPOSED BY POLYPEPTIDES DURING TRANSLATION AND MEMBRANE TRANSLOCATION, OR FOLLOWING STRESS-INDUCED DAMAGE.

-! INDUCTION: BY HEAT SHOCK.
